## **Burlington Solar One** **Drainage Summary**

The subject site is located in the Town of Burlington, on the north side of Prospect Street, comprising 62.98 acres of Industrial I Zone. Site soils are Hinkley [38], Canton/Charlton [62] soils in the upland areas associated with the proposed solar array. Inland wetland soils comprise 0.44 acres for a centrally located wetland within the property, 4.36 acres east side along the Wildcat Brook and 0.59 acres west side along the Whigville Brook. These wetland locations are all in excess of 100' from any activity associated with the construction of the proposed solar array. Site slopes vary from 1.6% to 13% within the proposed solar array area. Property historically was utilized as an earth removal site from the 1960's to current. Various small excavations and past disturbances are evident in the upland area of the proposed solar array.

The proposed solar project area is 11.6 acres located within a wooded upland area 1,500 l.f. north of Prospect Street. The project area disturbance is 111 l.f. away from wetlands along the Wildcat Brook, 230 l.f. from the centrally located wetland to stormwater quality basin, and 110 l.f. from the same to the outfall from the stormwater quality basin.

The majority of the solar site historically sheet flows to the area around and adjacent to the isolated wetland area (0.44 acres) and infiltrates into existing soils. The isolated wetland and surrounding areas are topographically not connected, in a surface drainage sense, to either the Wildcat Brook or the Whigville Brook drainage sheds.

Some site grading is utilized to establish uniform grades (8% or less) and drainage patterns within the solar site. A combination of two stormwater quality basins, infiltration trenches and grass lined swales are utilized to mitigate increase in run-off due to the project. The stormwater quality basins will have a multi-stage outlet design and emergency overflow. Both stormwater quality features include an up-slope 2% gradient grass infiltration and filter strip to provide primary treatment of up-gradient sheetflows. A stone infiltration trench is provided for both stormwater quality features to enhance the treatment process and will also provide a level of temporary sediment and erosion control during construction. These basins shall be utilized as temporary sediment basins during construction and have been sized appropriately for dry and wet storage requirements. Site design grades are 1%-5% (58% of area), 6%-7% (20% of area) and 8% (22% of area). The western stormwater quality basin will outlet into the eastern stormwater quality basin to further promote groundwater recharge and mitigation of peak run-off flows. Developed drainage flows from this project are not directed or outletted to areas adjacent to the brooks bordering the east and west property lines.

The connection to the solar field from a utility standpoint will follow the existing access road from Prospect Street into the site and northerly to the solar field area.

Overall peak flows have been reduced in the 2-year through 100-year storm events as shown in the tables below. In the area of proposed solar array, the hydrologic soil group has been reduced one group (from A to B, or B to C) in conformance with Appendix I “Stormwater Management at Solar Array Construction Projects”. Additionally, the imperviousness of the solar panels is not needed to be considered as the separation distance between each row of panels is greater than the width of the panels in a horizontal plane. This is also in conformance with Appendix I “Stormwater Management at Solar Array Construction Projects”.

<sup>1</sup> Precipitation frequency (PF) estimates in this table are based on frequency analysis of partial duration series (PDS).

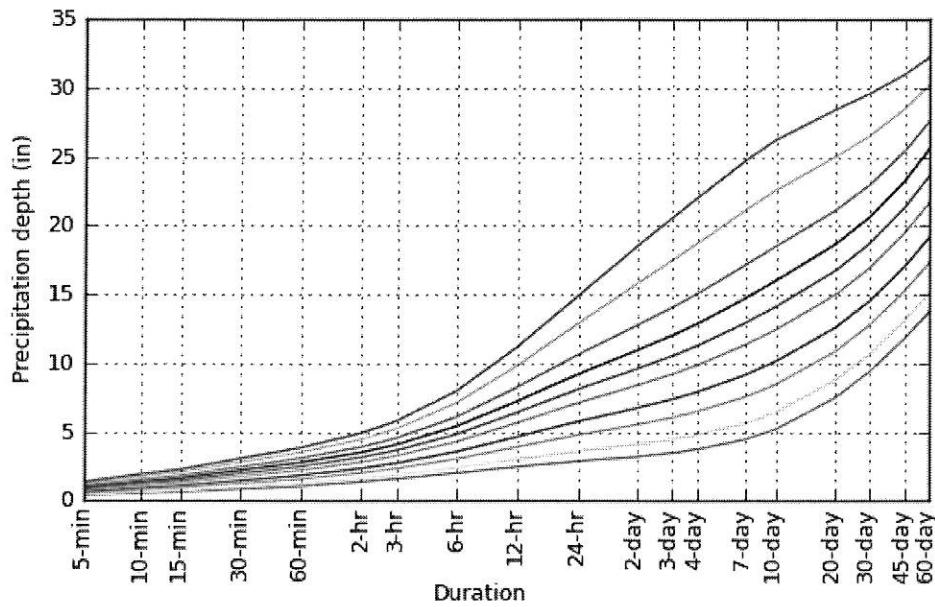

Numbers in parenthesis are PF estimates at lower and upper bounds of the 90% confidence interval. The probability that precipitation frequency estimates (for a given duration and average recurrence interval) will be greater than the upper bound (or less than the lower bound) is 5%. Estimates at upper bounds are not checked against probable maximum precipitation (PMP) estimates and may be higher than currently valid PMP values.

Please refer to NOAA Atlas 14 document for more information.

**MAP INFORMATION**

The soil surveys that comprise your AOI were mapped at 1:12,000.

Please rely on the bar scale on each map sheet for map measurements.

Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: State of Connecticut

Survey Area Data: Version 20, Jun 9, 2020

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Sep 25, 2019—Nov 9, 2019

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.
